Government Facility – More Storage Space Required

Our customer called looking to organize and maximize his warehouse space.

The Issues were different sized pallets and crushable products limiting stackability.
The ceiling height they had available could only go up to 24', top of storage.
The client's pallets could only be stacked 3 high due to the materials being stored.

The solution was to provide various beam sizes and uprights throughout the warehouse.
This handled the different weight capacities of each level and increased their storage height up to 24'.
This customization increased the client's pallet storage capacity from 468 pallets to 1042 pallets by going 5 high on pallet levels.
Additionally, custom designing the racking and optimizing aisles accommodated a side loader forklift.

This custom solution provided proper storage, easier product access and a safer work space.
